

ABSTRACT: The invention in this system is the SWITCH-KEY device. This is absolutely exclusive and no analog in the world. The switch-key device, which include two parts A and B works when two parts connected. Before the aircraft starts his flight, pilot from the secret cabin have to connect switch-key – to give “permission” to start . Without connection of switch-key pilots from main cabin can do nothing. If the situation on a board is normal the springs in the device are supporting contacts; if abnormal pilot from secret cabin changes position of handle of switch-key on 45 degree and operate flight by him self, completely turn off power from main cockpit.
